

ABSTRACT

A broadcasting station [[[10)]] transmits a program of continuous sequence of events as a transport stream so as to be received by at least a mobile receiver [[[100)]]]. The broadcasting station [[[10)]] provides the transport stream with link information showing the links between the transport stream it transmits in its own service area [[[10a)]] and the programs being transmitted in adjacent service areas [[[20a)]]]. With this arrangement, the mobile receiver [[[100)]] can receive the program it is receiving continuously in an adjacent service area [[[20a)]] by referring to the link information if it moves from the original service area [[[10a)]] into the adjacent service area [[[20a)]]].
